

How My Pal JSON works

My Pal JSON is a web-based API testing and JSON manipulation tool. Users can send HTTP requests to API endpoints, view responses, and perform various transformations on JSON data. The application supports drag-and-drop file uploads, request/response tabs, custom headers management, and multiple output formats including code generation in various programming languages.

The interface features a three-column layout with a request editor on the left, control buttons in the middle, and an output display on the right. Users can toggle between light and dark themes, save API calls to browser history, and copy results to clipboard. The tool includes features like JSON pretty-printing, analysis, and model/class generation from JSON structures.

Main JSON API Tester

Primary interface for sending API requests, editing JSON payloads, and viewing formatted output.
